

Step 1: Excel

I download the sales data set from Online Retail Dataset of kaggle's which was a CSV file I changed the name of the Dataset which is Sales Data and convert excel file and saved it. This data was not formatting data , So I have formatted this data in excel.

Here are the steps to formatting, cleaning Dataset:

1. I have correctly formatted the headings by making them bold and adjusting the writing style.
2. Then, I corrected the space and alignment for the remaining data structures.
3. I filled in the blank cells in the Invoice Date column, there was a '#' symbol which I corrected to NA. These steps are ; Select range -> press Ctrl+G -> open GO To -> Special -> Select blanks -> type value like NA -> press Ctrl+Enter.
4. I checked the Data set that there is no duplicate values.
5. There is a column of Unit Price there was a value 2.1 in two columns which Index is 11 and 12 , I applied this Number format is 2.10.
6. Finally I saved the Dataset name is Cleaned_data in excel file

I formatted and cleaned the dataset using these steps.
